Standby current	I_{STN-BY}	$I_L=0$, $V_{IN}=12\text{V}$			5.0	mA

Note: 1. Guaranteed by design.

2. Regulation is measured at constant junction temperature, using pulsed on time.

3. Current limit is measured at constant junction temperature, using pulsed on time.

4. Dropout is measured at constant junction temperature, using pulsed on time, and the criterion is V_{OUT} inside target value $\pm 2\%$.

5. Dropout test is skipped at the condition of $V_{IN}<3\text{V}$.

■ TYPICAL APPLICATION CIRCUIT

The part may oscillate without the capacitor, a 10μF (or larger) capacitor is recommended between V_{OUT} and GND for stability. Any type of capacitor can be used, but not Aluminum electrolytic when operating below -20°C. The capacitance may be increased without limit. Besides, another 1μF capacitor (or larger) should be placed between V_{IN} to GND.

■ UR132 ADJUSTABLE

Cr:10μF to improve ripple rejection

$$V_{OUT} = V_{REF}(1 + R2/R1) + I_{ADJ} \times R2$$
