■ SPECIAL CONSIDERATIONS

In applications where separate power sources are used to drive V_{DD} and the signal input, the V_{DD} current capability should exceed V_{DD}/R_L (R_L =effective external load of the UTC 4066 bilateral switches).This provision avoids any permanent current flow or clamp action of the V_{DD} supply when power is applied or removed from UTC 4066.

In certain applications, the external load-resistor current may include both V_{DD} and Signal-line components. To avoid drawing V_{DD} current when switch current flows into terminals 1,4,8 or 11,the voltage drop across the bidirectional swith must not exceed 0.6V at $T_A \leq 25^\circ C$, or 0.4V at $T_A > 25^\circ C$ (calculated from R_{ON} values shown).

NO V_{DD} current will flow through R_L if the switch current flows into terminals 2, 3, 9 or 10.
