## CD4541

## **PROGRAMMABLE TIMER**

### DESCRIPTION

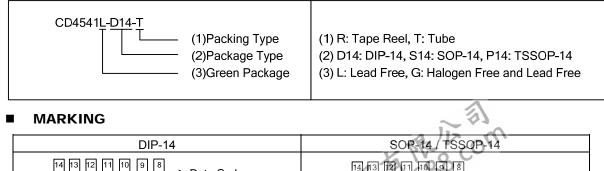

The **CD4541** programmable timer comprise a 16-stage binary counter, an integrated oscillator for use with an external capacitor and two resistors, output control logic, and a special power-on reset circuit. The counter divides the oscillator frequency by any of 4 digitally controlled division ratios.

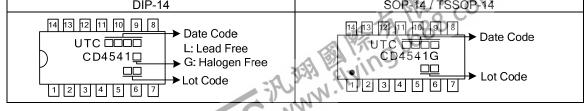

### FEATURES

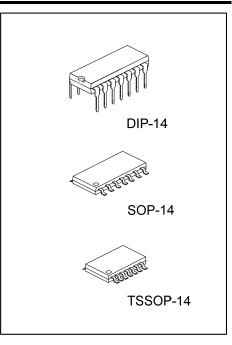

- \* Operates at 2<sup>n</sup> frequency divider or as single transition timer
- \* Increments on positive edge clock transitions
- \* Wide supply voltage range: 3.0V ~ 15V
- \* Built-in low power RC oscillator
- \* Oscillator frequency range ~ DC to 100 kHz
- \* External clock applied to Pin 3 can be used instead of oscillator
- \* Available division ratios  $2^8$ ,  $2^{10}$ ,  $2^{13}$ , or  $2^{16}$
- \* High noise immunity: 0.45 V<sub>DD</sub> (typ)
- \* Master reset totally independent of automatic reset operation
- \* Automatic reset initializes all counters when power turns on
- \*  $Q/\overline{Q}$  select provides output logic level flexibility
- \* High output drive min. one TTL load
- \* Maximum input leakage 1µA at 15V over full temperature range

### ORDERING INFORMATION

Ordering Number		Daakaga	Dooking	
Lead Free	Halogen Free	Package	Packing	
CD4541-D14-T	CD4541L-D14-T	DIP-14	Tube	
-	CD4541L-S14-R	SOP-14	Tape Reel	
-	- CD4541L-P14-T		Tube	

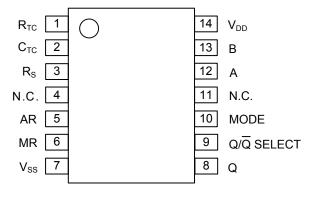

# CD4541

### PIN CONFIGURATION

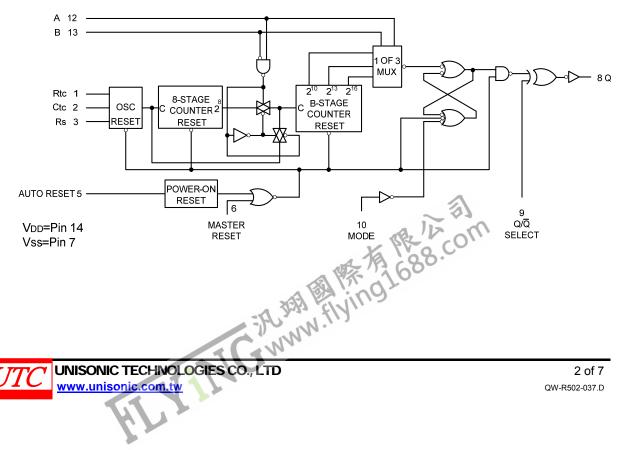

### TRUTH TABLE

PIN	STATE			
	0	1		
5	Auto Reset Operating	Auto Reset Disabled		
6	Timer Operational	Master Reset On		
9	Output Initially Low after Reset	Output Initially High after Reset		
10	Single Cycle Mode	Recycle Mode		

### DIVISION RATIO TABLE

А	В	Number of Counter Stages n	Count 2 <sup>n</sup>
0	0	13	8192
0	1	10	1024
1	0	8	256
1	1	16	65536

#### **ABSOLUTE MAXIMUM RATING**

PARAMETER		SYMBOL	RATINGS	UNIT
Supply Voltage		V <sub>DD</sub>	-0.5 ~ +18	V
Input Voltage		V <sub>IN</sub>	-0.5 ~ V <sub>DD</sub> +0.5	V
Power Dissipation	DIP-14	D	700	10010/
	SOP-14/ TSSOP-14	PD	500	mW
Junction Temperature		TJ	125	°C
Operating Temperature		T <sub>OPR</sub>	-20 ~ +85	°C
Storage Temperature		T <sub>STG</sub>	-40 ~ +150	°C

Note: Absolute maximum ratings are those values beyond which the device could be permanently damaged. Absolute maximum ratings are stress ratings only and functional device operation is not implied.

#### **RECOMMENDED OPERATING CONDITIONS**

PARAMETER	SYMBOL	RATINGS	UNIT
Supply Voltage	V <sub>DD</sub>	3 ~ 15	V
Input Voltage	V <sub>IN</sub>	0 ~ V <sub>DD</sub>	V
Operating Temperature	T <sub>OPR</sub>	-40 ~ +85	°C

#### DC ELECTRICAL CHARACTERISTICS (T<sub>A</sub>=25°C, unless otherwise specified.)

	f <sub>CL</sub>	V <sub>DD</sub> =5V		2.5	1.0		
Clock Pulse Frequency		V <sub>DD</sub> =10V		6.0	3.0	MHz	
		V <sub>DD</sub> =15V		8.5	4.0		
	t <sub>wH(R)</sub>	V <sub>DD</sub> =5V	400	170			
MR Pulse Width		V <sub>DD</sub> =10V	200	75		ns	
		V <sub>DD</sub> =15V	150	50			
Average Input Capacitance	Cı	Any Input		5.0	7.5	рF	
Power Dissipation Capacitance	C <sub>PD</sub>	(Note 2)		100		pF	

Notes: 1. AC Parameters are guaranteed by DC correlated testing.

2. C<sub>PD</sub> determines the no load AC power consumption of any CMOS device.

### OPERATING CHARACTERISTICS

With Auto Reset pin set to a "0" the counter circuit is initialized by turning on power. Or with power already on, the counter circuit is reset when the Master Reset pin is set to a "1". Both types of reset will result in synchronously resetting all counter stages independent of counter state.

The RC oscillator frequency is determined by the external RC network, i.e.:

$$f=\frac{1}{2.3 R_{TC}C_{TC}}$$
 if (1 kHz  $\leq f \leq 100$  kHz)

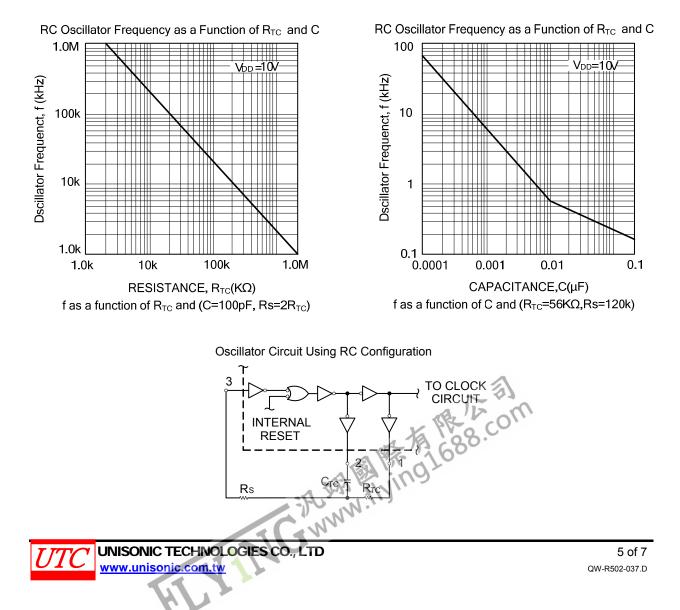

and RS ~ 2 R<sub>TC</sub> where RS  $\geq$  10 k $\Omega$ 

The time select inputs (A and B) provide a two-bit address to output any one of four counter stages  $(2^8, 2^{10}, 2^{13}, and 2^{16})$ . The 2<sup>n</sup> counts as shown in the Division Ratio Table represent the Q output of the Nth stage of the counter. When A is "1", 2<sup>16</sup> is selected for both states of B.

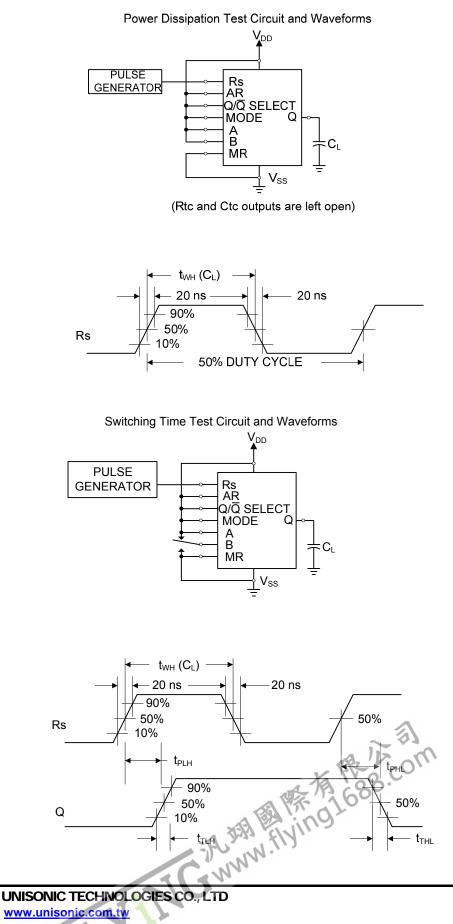

However, when B is "0", normal counting is interrupted and the 9th counter stage receives its clock directly from the oscillator (i.e., effectively outputting  $2^8$ ).

The  $Q/\overline{Q}$  select output control pin provides for a choice of output level. When the counter is in a reset condition and Q/Q select pin is set to a "0" the Q output is a "0". Correspondingly, when  $Q/\overline{Q}$  select pin is set to a "1" the Q output is a "1".

When the mode control pin is set to a "1", the selected count is continually transmitted to the output. But, with mode pin "0" and after a reset condition the RS flip-flop resets (see Logic Diagram), counting commences and after  $2^{n-1}$  counts the RS flip-flop sets which causes the output to change state. Hence, after another  $2^{n-1}$  counts the output will not change. Thus, a Master Reset pulse must be applied or a change in the mode pin level is required to reset the single cycle operation.

### TEST CIRCUIT AND WAVEFORMS
