LLV321

LINEAR INTEGRATED CIRCUIT

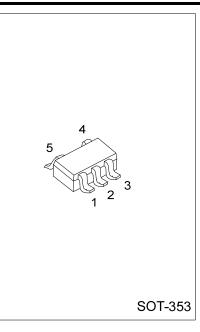

GENERAL PURPOSE, LOW VOLTAGE, RAIL-TO-RAIL OUTPUT AMPLIFIERS

DESCRIPTION

The LLV321 is a single, low cost and voltage feedback amplifier, that consumes only 80µA supply current, 1.2MHz of bandwidth and 1.5V/µs of slew rate at a low supply voltage of 2.7V. It is supplied from 2.7V (±1.35V) to 5.5V (±2.75V). The common mode voltage range extends below the negative rail and the output provides rail-to-rail performance.

The LLV321 is fabricated on a CMOS process. The combination of low power, rail-to-rail performance, low voltage operation, and tiny package options makes the device well suited for use in personal electronics equipment such as cellular handsets, pagers, PDAs, and other battery powered applications.

The LLV321 is also applied in portable test instruments, telephone systems, low cost general purpose applications, cellular phones, MP3 players, personal data assistants, A/D buffer, DSP interface, audio applications, smart card readers, keyless entry, Infrared receivers for remote controls, digital still cameras and hard disk drives.

FEATURES (at 2.7V)

- * Input Voltage Varies From -0.25V to +1.5V
- * Supply Current: 80µA
- * Output Voltage Varies from 0.01V to 2.69V
- * Gain Bandwidth: 1.2MHz
- * Slew Rate: 1.5V/us
- * Fully Specified at +2.7V and +5V Supplies
- * Operating Temperature Range: -40°C ~ +125°C
- * Halogen Free

LLV321

APPLICATION INFORMATION

General Description

The UTC **LLV321** is a low cost, single supply, low voltage and voltage feedback amplifier which is characterized a rail- to- rail output. It is designed to operate on a CMOS process, and is unity gain stable. Figure 1 shows the typical non-inverting circuit schematic

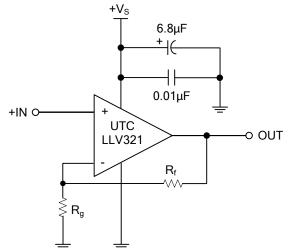

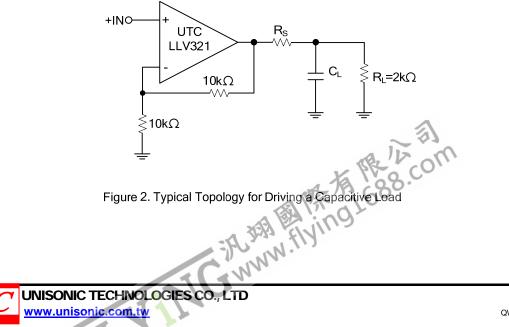

Figure 1. Typical Non-Inverting Configuration

Power Dissipation

For the UTC **LLV321**, the maximum internal power dissipation is directly depending on the maximum junction temperature. If the maximum junction temperature is higher than 150°C, some performances are declined. If the maximum junction temperature becomes higher than 175°C for an extended time, device failure may be cause.

Driving Capacitive Loads

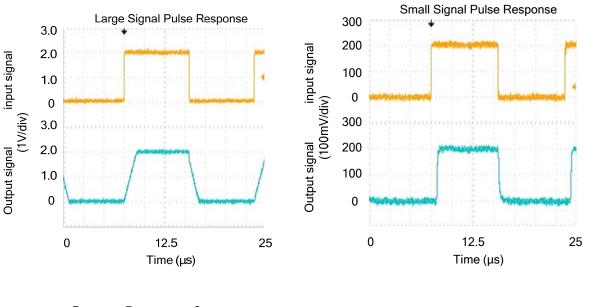

In figure 2, a small series resistance (R_s) at the output of the amplifier, will improve stability and settling performance. Driving a capacitive load introduces phase-lag into the output signal, which reduces phase margin in the amplifier. The unity gain follower is the most sensitive configuration. In a unity gain follower configuration, the UTC **LLV321** requires a 450 Ω series resistor to drive a 200pF load. The response is as seen in TYPICAL CHARACTERISTIC.
