## LINEAR INTEGRATED CIRCUIT

### PRECISION MICROPOWER SHUNT VOLTAGE REFERENCE

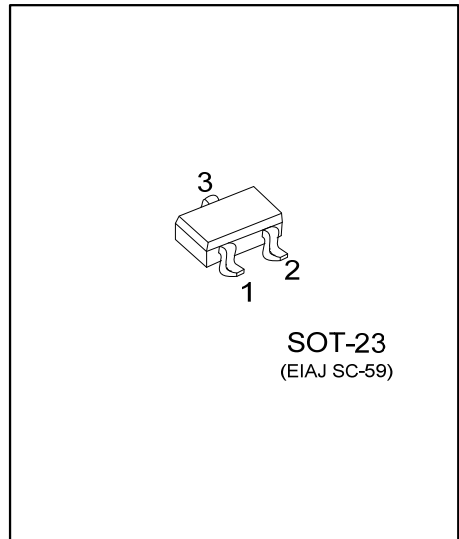

#### DESCRIPTION

As a shunt voltage reference integrated circuit, UTC **LM4041** can be used for widespread applications with enhancement of the competitive advantage by saving use of external capacitors..

In order to ensure a stable output voltage, the reference not only offers low dynamic impedance, low noise and a low temperature coefficient, but also provides tight output tolerance (Max 1.0 %) and low temperature coefficient (150ppm/°C).

There are two versions of 1.225V and adjustable reverse breakdown voltage. The minimum operating current is 45  $\mu$ A for the LM4041-1.2 and the LM4041-ADJ.

However, for those applications which the output voltage needs to be adjusted between 1.233V and 10V, an external resistor divider is necessary.

#### FEATURES

\*Output Tolerances and Temperature Coefficient: Max 1.0%, 150 ppm

\*Low Output Noise : 20 $\mu$ V<sub>RMS</sub> (Typ.)

\* Operating Current range : 45 $\mu$ A ~ 12mA

■ ABSOLUTE MAXIMUM RATING ( $T_A = 25^\circ\text{C}$ , unless otherwise specified.)

PARAMETER	SYMBOL	RATINGS	UNIT
Continuous Cathode Voltage	$V_Z$	15	V
Continuous Cathode Current	$I_Z$	-10 ~ +25	mA
Junction Temperature	$T_J$	+150	$^\circ\text{C}$
Storage Temperature	$T_{\text{STG}}$	-65 ~ +150	$^\circ\text{C}$

Note: Absolute maximum ratings are those values beyond which the device could be permanently damaged. Absolute maximum ratings are stress ratings only and functional device operation is not implied.

■ RECOMMENDED OPERATING CONDITIONS

PARAMETER	SYMBOL	RATINGS	UNIT
Cathode Current (max)	$I_Z$	12	mA
Reverse Breakdown Voltage	$V_Z$	10	V
Operating Temperature	$T_A$	-40 ~ +85	$^\circ\text{C}$

■ THERMAL DATA

PARAMETER	SYMBOL	RATINGS	UNIT
Junction to Ambient	$\theta_{JA}$	206	$^\circ\text{C}/\text{W}$

Note: Maximum power dissipation is a function of  $T_{J(\text{max})}$ ,  $\theta_{JA}$ , and  $T_a$ . The maximum allowable power dissipation at any allowable ambient temperature is  $P_D = (T_{J(\text{max})} - T_a) / \theta_{JA}$ . Operating at the absolute maximum  $T_J$  of  $150^\circ\text{C}$  can affect reliability.

**■ APPLICATION INFORMATION**

$V_Z$  is set according to the equation shown as below which can be set by a user-defined resistor divider.

**Cathode and Load Currents**

The total current available to supply the load ( $I_L$ ) and bias the UTC **LM4041** ( $I_Z$ ) is set by  $R_S$ , so its value must be set properly. In all cases,  $I_Z$  must stay in a specified range for proper operation of the reference;  $R_S$  must be small enough to supply the minimum  $I_Z$ . At maximum  $V_S$  and minimum  $I_L$ , to limit  $I_Z$  to not exceed rating of 12 mA,  $R_S$  must be large enough.

$$R_S = \frac{(V_S - V_Z)}{(I_L + I_Z)}$$
