

LM556

LINEAR INTEGRATED CIRCUIT

DUAL TIMER

DESCRIPTION

The UTC **LM556** dual monolithic circuit is a highly stable controller capable of producing accurate delays or oscillation. The UTC **LM556** is the dual of UTC NE555; timing is provided an external resistor and capacitor for each function. The two timers operate independently of each other, sharing only V_{CC} and GND. The circuits may be triggered and reset on falling wave forms. The output structures may sink or source 200mA.

FEATURES

- *High Current Driver Capability(=200mA)
- *Adjustable Duty Cycle
- *Timing From μ Sec to Hours
- *Temperature Stability of 0.005%/°C
- *TTL Compatible
- *Operates in Both Astable and Monostable Modes

Notes: 1. Supply current when output is high is typically 1mA less at $V_{CC}=5\text{V}$.

2. Tested at $V_{CC}=5\text{V}$ and $V_{CC}=15\text{V}$.

3: This will determine the maximum value of R_A+R_B for 15V operation, The maximum total is $R=20\text{M}\Omega$, and for 5V operation the maximum total is $R=6.6\text{M}\Omega$.

4: As reset voltage lower, timing is inhibited and then the output goes low.

5: Matching parameters refer to the difference between performance parameters of each timer section in the monostable mode.
