

LR4XXYY

Preliminary

CMOS IC

Dual, Low-Noise, 200mA LDO REGULATOR

DESCRIPTION

The UTC **LR4XXYY** are dual voltage regulator ICs that have high output voltage accuracy, low dropout, low supply current, and high ripple rejection. Every Channel of UTC **LR4XXYY** series consists of a voltage reference unit and over temperature protection, simultaneity; also consists of an error amplifier, a current limit circuit, resistors for setting output voltage, and a chip enable circuit, respectively. The EN1 and EN2 pins control each output respectively. When both outputs shutdown simultaneously, the chip will be turn off and consumes nearly zero operation current which is suitable for battery-power devices.

The load transient response and line transient response of the UTC **LR4XXYY** Series are excellent, so these ICs are suitable for hand-held communication equipment power supply.

Notes: 1. Limits beyond which damage to the device may occur is indicated by absolute maximum ratings. Conditions for which the device is intended to be functional is indicated by operating ratings, but specific performance` limits isn't be guaranteed. Only for the test conditions listed the guaranteed specifications can be applied. When the device is not operated under the listed test conditions some performance characteristics may degrade.

2. Which discharged through a $1.5k\Omega$ resistor into each pin is a $100pF$ capacitor in the human body model.

3. The dropout voltage is defined as $V_{IN} - V_{OUT}$, which is measured when V_{OUT} is $V_{OUT(NORMAL)} - 100mV$.
