CMOS IC

BCD-TO-SEVEN SEGMENT LATCH/DECODER/DRIVER

DESCRIPTION

The UTC **MC14511** BCD-to-seven segment latch/decoder/driver is constructed with complementary MOS (CMOS) enhancement mode devices and NPN bipolar output drivers in a single monolithic structure. The circuit provides the functions of a 4-bit storage latch, an 8421 BCD-to-seven segment decoder, and an output drive capability. Lamp test (\overline{LT}), blanking (\overline{BI}), and latch enable (LE) inputs are used to test the display, to turn-off or pulse modulate the brightness of the display, and to store a BCD code, respectively. It can be used with seven-segment light-emitting diodes (LED), incandescent, fluorescent, gas discharge, or liquid crystal readouts either directly or indirectly.

Applications include instrument (e.g., counter, DVM, etc.) display driver, computer/calculator display driver, cockpit display driver, and various clock, watch, and timer uses.

FEATURES

- * Low Logic Circuit Power Dissipation
- * High-Current Sourcing Outputs (Up to 25 mA)
- * Latch Storage of Code
- * Blanking Input
- * Lamp Test Provision
- * Readout Blanking on all Illegal Input Combinations
- * Lamp Intensity Modulation Capability
- * Time Share (Multiplexing) Facility
- * Supply Voltage Range = 3.0V ~ 18V

■ ABSOLUTE MAXIMUM RATINGS (Note 3)

PARAMETER	SYMBOL	RATINGS	UNIT
DC Supply Voltage Range	V_{DD}	-0.5 ~ +18.0	V
Input Voltage Range, All Inputs	V_{IN}	-0.5 ~ $V_{DD}+0.5$	V
DC Current Drain per Input Pin	I	10	mA
Power Dissipation, per Package	P_D	500	mW
Maximum Output Drive Current (Source) per Output	I_{OHMAX}	25	mA
Maximum Continuous Output Power (Source) per Output (Note 2)	P_{OHMAX}	50	mW
Operating Temperature Range	T_A	-55 ~ +125	°C
Storage Temperature Range	T_{STG}	-65 ~ +150	°C

Notes: 1. Absolute maximum ratings are those values beyond which the device could be permanently damaged.

Absolute maximum ratings are stress ratings only and functional device operation is not implied.

2. $P_{OHMAX} = I_{OH} (V_{DD} - V_{OH})$

3. This device contains protection circuitry to protect the inputs against damage due to high static voltages or electric fields. However, it is advised that normal precautions be taken to avoid application of any voltage higher than maximum rated voltages to this high-impedance circuit. A destructive high current mode may occur if V_{IN} and V_{OUT} are not constrained to the range:

$$V_{SS} \leq (V_{IN} \text{ or } V_{OUT}) \leq V_{DD}$$

Due to the sourcing capability of this circuit, damage can occur to the device if V_{DD} is applied, and the outputs are shorted to V_{SS} and are at a logical 1 (See Maximum Ratings).

Unused inputs must always be tied to an appropriate logic voltage level (e.g., either V_{SS} or V_{DD}).

Notes: 1. Noise immunity specified for worst-case input combination..

Noise Margin for both "1" and "0" level =

1.0 V min @ V_{DD} = 5.0 V

2.0 V min @ V_{DD} = 10 V

2.5 V min @ V_{DD} = 15 V

2. The formulas given are for the typical characteristics only at 25°C.

3. To calculate total supply current at loads other than 50 pF:

$$I_T(C_L) = I_T(50 \text{ pF}) + 3.5 \times 10^{-3} (C_L - 50) V_{DD}f.$$

Where: I_T is in µA (per package), C_L in pF, V_{DD} in Vdc, and f in kHz is input frequency
