

MC34018

LINEAR INTEGRATED CIRCUIT

VOICE SWITCHED SPEAKER-PHONE CIRCUIT

DESCRIPTION

The UTC **MC34018** speaker-phone integrated circuit includes all the active circuitry and control functions to implement a high quality hands-free telephone system. The circuit includes a microphone amplifier, a speaker amplifier, level detectors, a background sound level monitoring system in both the transmit and receive channels and an attenuation system which can control the transmit and receive levels as well as the background level.

The applications include household and office speaker-phones, intercom systems, hand free kit for mobile phones, and others.

FEATURES

- * Chip Select pin for Power conservation (active/standby mode).
- * Integrated all necessary active circuitry for a hand-free telephone into one single chip.
- * Operating under wide dynamic range through signal compression technology.
- * Build-In voltage regulators illuminate external regulators for lining operation.
- * Monitoring system for background noise level.
- * Background sound level compensation for transmit and receive levels as well as the background level.
- * Power audio amplifier for typical 100mW output (into 25Ω) with peak limiting for speaker to minimize distortion.
- * Volume control function for external volume control circuit.

PIN CONFIGURATION

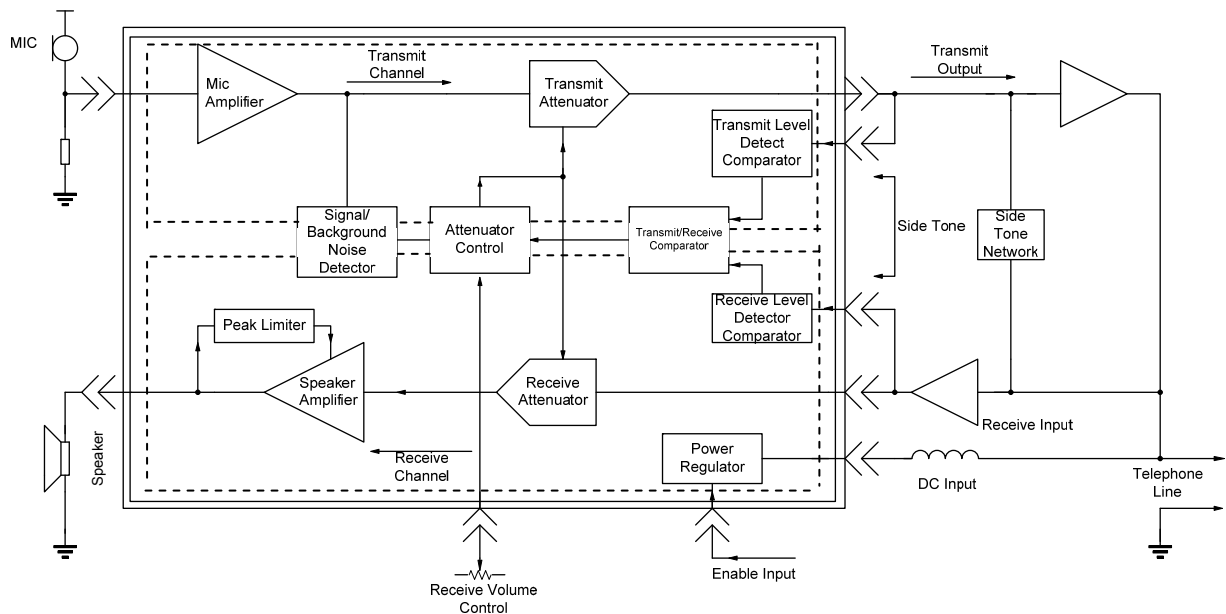

■ PIN DESCRIPTION

PIN NO.	PIN NAME	DESCRIPTION
1	RR	A resistor to ground provides a reference current for the transmit and receive attenuators
2	RTX	A resistor to ground determines the nominal gain of the transmit attenuator, the transmit channel gain is inversely proportional to RTX resistance.
3	TXI	Transmit Attenuator Input, Input resistance is nominally 5.0k Ω .
4	TXO	Transmit Attenuator Output, The TXO output signal drives the input of transmit level detector, as well as the external circuit which drives the telephone line.
5	TLI	Transmit Level detector Input. An external resistor ac coupled to The TLI pin sets the detection level. Decreasing this resistor increases the sensitivity to transmit channel signals.
6	TLO	Transmit Level detector Output. The external resistor and capacitor set the time the comparator will hold the system in the transmit mode after speech ceases.
7	RLI	Receive Level detector Input. An external resistor ac coupled to The RLI pin sets the detection level. Decreasing this resistor increases the sensitivity to receive channel signals.
8	RLO	Receive Level detector Output. The external resistor and capacitor set the time the comparator will hold the system in the receive mode after speech ceases.
9	MCI	Microphone amplifier input. Input impedance is nominally 10k Ω and the dc bias voltage is approximately equal to VB
10	MCO	Microphone amplifier output. The MIC amp gain is internally set at 34dB (50V/V).
11	CP1	A parallel resistor and capacitor connected between this pin and VCC holds a voltage corresponding to the background noise level. The transmit detector compares the CP1 voltage with the speech signal from CP2.
12	CP2	A capacitor at this pin peak detects the speech signals for comparison with the background noise level held at CP1.
13	XDI	Input to the transmit detector system. The microphone amplifier output is ac coupled to the XDI pin through an external resistor.
14	SKG	High current ground pin for the speaker amplifier output stage. The SKG voltage should be within 10mV of the ground voltage at pin 22.
15	SKO	Speaker amplifier output. The SKO pin will source and sink up to 100mA when ac coupled to the speaker. The speaker amplifier gain is internally set at 34dB (50V/V).
16	V+	Input DC supply voltage. V+ can be powered from Tip and Ring if an ac decoupling inductor is used to prevent loading ac line signals. The required V+ voltage is 6.0V to 11V (7.5V nominal) at 7.0mA.
17	AGC	A capacitor from this pin to VB stabilizes the speaker amplifier gain control loop, and additionally controls the attack and decay time of this circuit. The gain control loop limits the speaker amplifier input to prevent clipping at SKO. The internal resistance at AGC pin is nominally 110k Ω .
18	CS	Digital chip select input. When at a logic "0" (<0.7V) the VCC regulator is enabled. When at a logic "1" (>1.6V), the chip is in the standby mode drawing 0.5mA. An open CS pin is a logic "0". Input impedance is nominally 140k ohms. The input voltage should not exceed 11V.
19	SKI	Input to the speaker amplifier. Input impedance is nominally 20k Ω .
20	VCC	A 5.4V regulated output which powers all circuits except the speaker amplifier output stage. VCC can be used to power external circuitry such as a microprocessor(3.0mA max.) A filter capacitor is required. The UTC MC34018 can be powered by a separate regulated supply by connecting V+ and VCC to a voltage between 4.5V and 6.5V while maintaining CS at a logic "1".
21	VB	An output voltage equal to approximately VCC/2 which series as an analog ground for the speakerphone system. Up to 1.5mA of external load current may be sourced from VB. Output impedance is 250 ohms. A filter capacitor is required.
22	GND	Ground pin for the IC(except the speaker amplifier)

■ PIN DESCRIPTION(Cont.)

PIN NO.	PIN NAME	DESCRIPTION
23	XDC	Transmit detector output. A resistor and capacitor at his pin hold the system in the transmit mode during pauses between words or phrases. When the XDC pin voltage decays to ground, the attenuators switch from the transmit mode to idle mode. The internal resistor at XDC is nominally 2.6k ohms(see Fig.1).
24	VLC	Volume control input>connecting this pin to the slider of a variable resistor provides receive mode volume control. The VLC pin voltage should be less than or equal to VB.
25	ACF	Attenuator control filter. A capacitor connected to this pin reduces noise transient as the attenuator control switches level of attenuation.
26	R XO	Receive attenuator Output. Normally this pin is ac coupled to the input of the speaker amplifier.
27	R XI	Receive attenuator Input. Input impedance is nominally is 5.0kΩ.
28	RRX	A resistor to ground determines the nominal gain of the receive attenuator. The receive channel gain is directly proportional to the RRX resistance.
