

WIDE INPUT 2A SYNCHRONOUS RECTIFIED STEP-DOWN CONVERTER

DESCRIPTION

The UTC **P2680** is a monolithic synchronous step-down, fixed 340kHz frequency, current-mode, PWM controller with an internal power MOSFET. It achieves 2A continuous output current over a wide input supply range from 4V to 26V with excellent load and line regulation. Equipped with an external compensation pin, this device offers user flexibility in determining loop dynamic.

Current mode control provides fast transient response and cycle-by-cycle current limit. A PWM control circuit can provide the duty ratio from 0 up to 90% linearly. An Under-Voltage-Lock-Out (UVLO) circuit monitors the VIN supply voltage to prevent wrong logic controls. Additional under voltage protections monitor the voltage on FB pin for short-circuit protections.

In application, the UTC **P2680** is suitable for portable devices when it works as an ideal power supply in SOP-8L package.

PIN CONFIGURATION

PIN DESCRIPTION

PIN NO.	PIN NAME	DESCRIPTION
1	BST	Bootstrap pin. Positive supply for the upper MOSFET driver.
2	V _{IN}	Power supply pin.
3	SW	Power switch output pin.
4	GND	Ground pin.
5	FB	The output voltage feedback pin. It is also the inverting input of the error amplifier.
6	COMP	Compensation pin. It is also the output of the internal error amplifier.
7	EN	Enable Input. A high input at EN turns on the converter, and a low input turns it off.
8	SS	Soft-Start pin. Connect a capacitor from SS to GND to set the soft-start period. To disable the soft-start feature, leave SS unconnected.
