LINEAR INTEGRATED CIRCUIT

3-PHASE MOTOR DRIVER FOR CD-ROMS

DESCRIPTION

The UTC **UA9849** is ICs developed for CD-ROM spindle motor drives. These ICs possess a short brake and reverserotation brake for two types of brake functions, and also contain FG output and rotation direction detection (FR) circuits, making them high-functionality and high-performance ICs.

FEATURES

- * Three-phase, full-wave, pseudo-linear drive system.
- * Built-in power save and thermal shutdown functions.
- * Built-in current limiter and Hall bias circuits.
- * Built-in FG output.
- * Built-in rotation direction detector.
- * Built-in reverse rotation prevention circuit.
- * Built-in short brake pin.

■ ABSOLUTE MAXIMUM RATINGS

PARAMETER	SYMBOL	RATINGS	UNIT
Applied Voltage (with 5V Power Supply)	V_{CC}	7	V
Applied Voltage (motor Power Supply1)	V_{M1}	16	V
Applied Voltage (motor Power Supply2)	V_{M2}	16	V
Output Current(Note 4)	I_{OUT}	1.3	A
Power Dissipation(Note 2)	P_D	2.2	W
Operating Temperature	T_{OPR}	-20 ~ 75	°C
Storage Temperature(Note 3)	T_{STG}	-55 ~ 150	°C

Note: 1. Absolute maximum ratings are those values beyond which the device could be permanently damaged.

Absolute maximum ratings are stress ratings only and functional device operation is not implied.

2. Reduced by 17.6mW for increase for T_A of 1°C over 25°C

3. T_J should not exceed 150°C

4. T_J should not exceed P_D or ASO value.

■ CIRCUIT OPERATION

(1) Hall input to coil output

The phase relationship between the Hall input signals and the output current and voltage is shown in Fig.9. The motor position data input via the Hall pins is amplified by the Hall amplifier, and formed into waveforms by the matrix block. These signals are input to the output driver that supplies the drive current to the motor coils.

Fig.9

■ CIRCUIT OPERATION(Cont.)

(2) Torque command

The RNF pin voltage with respect to the torque command (EC) is as follows:

Fig.10

The I/O gain (GEC) from the EC pin to the RNF pin (output current) is determined by the RNF detector resistor.

$$GEC = 0.255 / RNF [A / V]$$

The torque limit current ITL is given by: $ITL = 0.35 / RNF [A]$

ROTATION DIRECTION	
$E_c < E_{CR}$	FORWARD
$E_c > E_{CR}$	REVERSE(Note)

Note: Stops after detecting reverse

(3) Reverse rotation detection function

Fig.11

FR SIGNAL OUTPUT PIN	
FORWARD	L
REVERSE	H

The reverse detection circuit construction is shown in Fig.11.

(1) Forward ($E_c < E_{CR}$)

The phase relationship between the Hall input signals H_{2+} and H_{3+} becomes as shown in Fig.9, and the reverse rotation detection circuit does not operate.

(2) Reverse ($E_c > E_{CR}$)

The phase relationship between the signals H_{2+} and H_{3+} is opposite that for forward operation, and the reverse rotation detection circuit operates. The output goes OFF, and becomes open circuit.

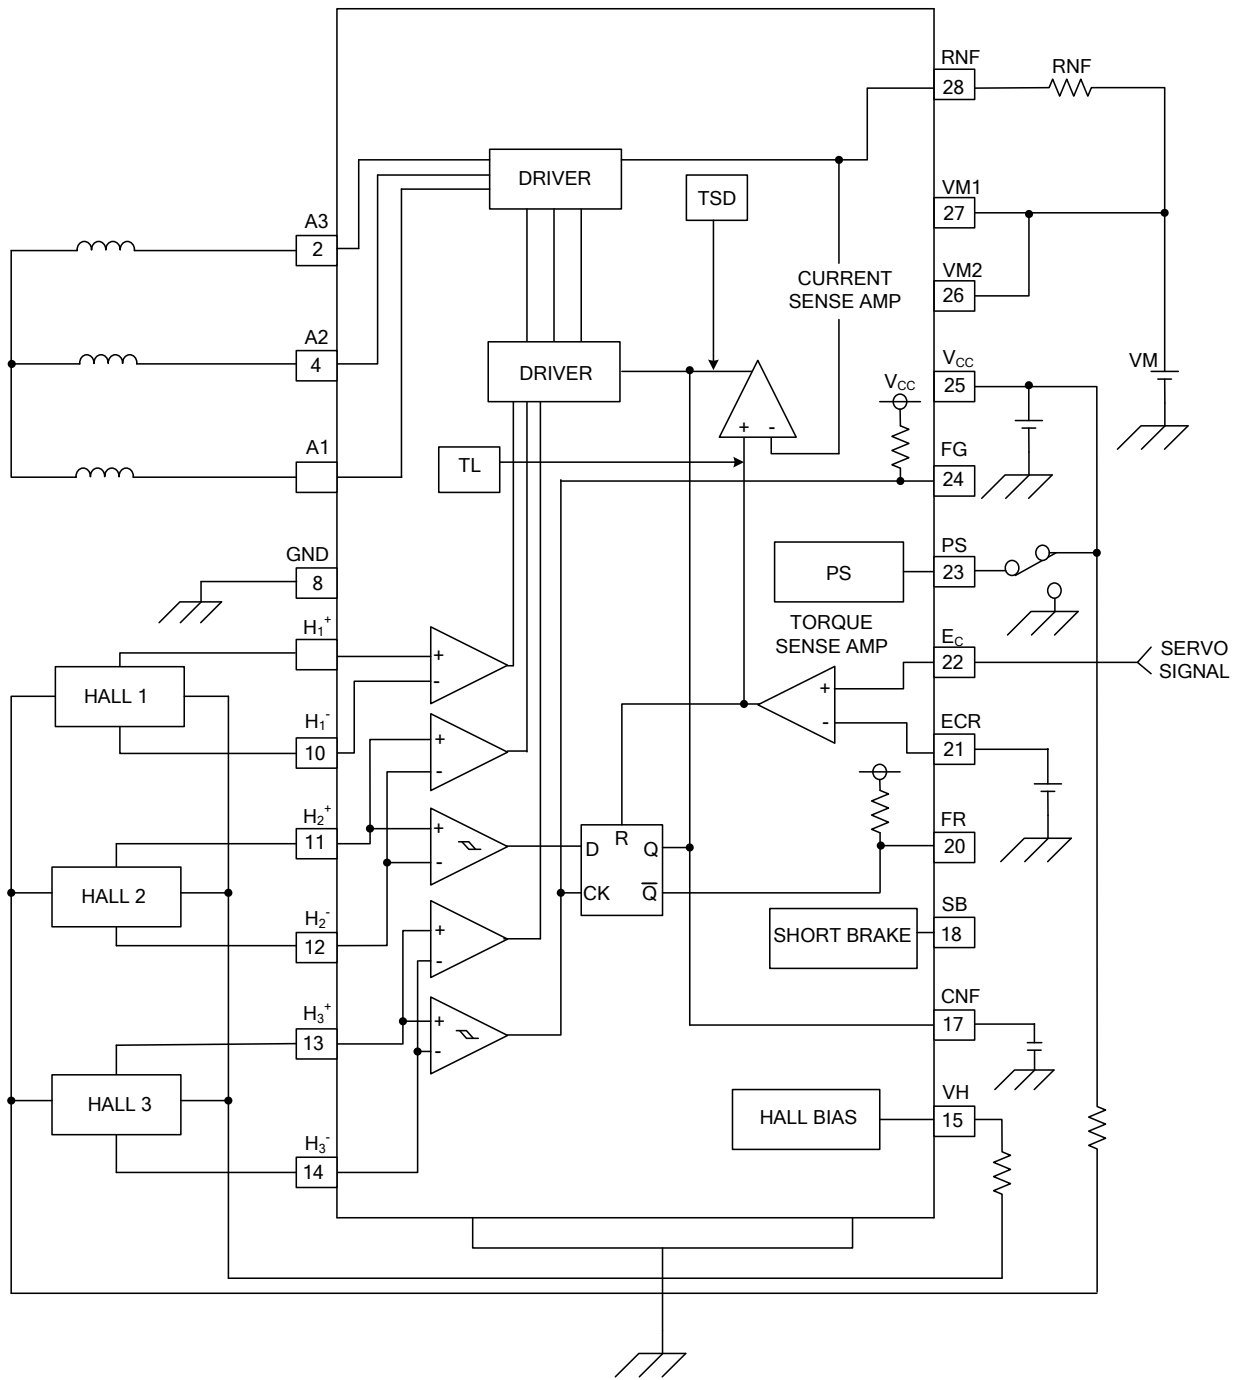

(3) Short brake

When 3.5V or more is applied to the short brake pin, the upper-side output transistors of all go off, and the lower-side output transistors go on. Short braking operates regardless of the torque command signal.

(4) Other circuits

When 3.5V or more is applied to the power save pin, all circuits are on. When 1.5V or less is applied, the IC enters power save mode. Also, the Hall bias pins turn on and off with the power save pin.

■ TYPICAL APPLICATION

■ OPERATION NOTES

(1) Power save

The power save input is an I / O circuit like the own shown in Fig.1.

The thermal derating characteristics of the power save pin is $-8\text{mV} / ^\circ\text{C}$, and the resistance will fluctuate between 30% so be careful of the input voltage range.

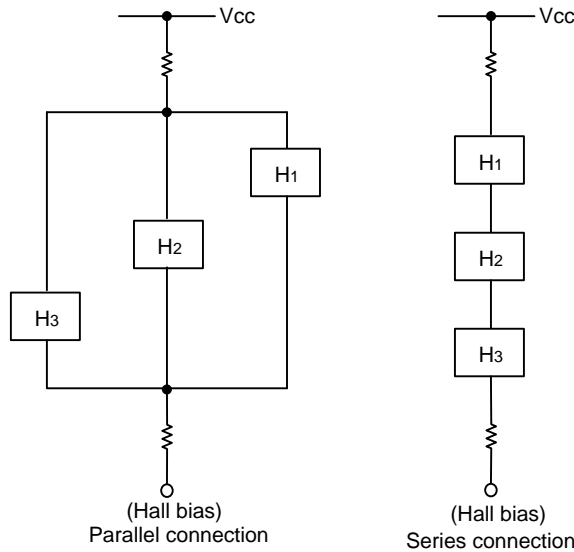

(2) Hall input

The input circuit shown in Fig.4 is used for the Hall inputs.

The Hall elements can be connected either in series or in parallel.

(3) Thermal shutdown (TSD)

When the junction temperature reaches 175°C , the A1, A2, and A3 coil outputs go open circuit. The thermal shutdown has approximately 15°C of hysteresis.
