PIN CONFIGURATION

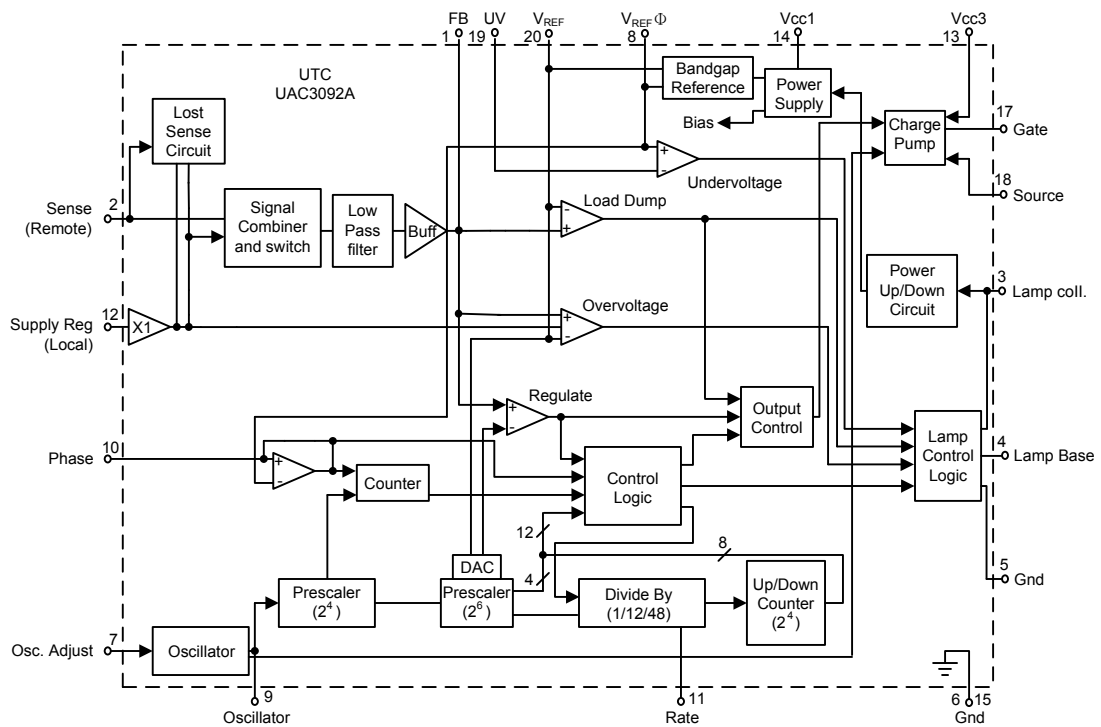

PIN DESCRIPTION

PIN NO.	PIN NAME	DESCRIPTION
1	FB	This pin provides Sense input or the Supply Regulation input.
2	Sense	The Sense input is input for the true battery voltage.
3	Lamp Collector and Power-Up/Down	This pin connects to drive the fault lamp. It is also used to sense a closed ignition switch (voltage sense).
4	Lamp Base	This pin provides base current to the fault lamp drive transistor (Q2).
5	Ground	This pin is for Ground return for the fault lamp control logic circuit.
6	Ground	IC ground
7	Oscillator Adjust	Connected to a resistor to ground that adjusts the internal oscillator frequency
8	V _{REF} Φ	This is a pin for the 1.1 V ~ 1.4 V reference voltage test.
9	Oscillator	This is a pin for checking the operation of the internal oscillator.
10	Phase	The Phase input detects the existence of a magnetic field rotating within the alternator.
11	Rate	The Rate pin is Load Response Control recovery rate selector pin used to select a slow mode (floating) or fast mode (ground).
12	Supply Regulation	The Supply Regulation pin is used as a representation of the alternator output voltage. This input also used to monitor overvoltage or load dump conditions.
13	Vcc3	Voltage supply for the internal Charge Pump.
14	Vcc1	Voltage supply for the entire IC except for the Charge Pump.
15	Ground	Ground for the IC.
16	N/C	No connection.
17	Gate	The Gate Controls of the MOSFET used to energize the field winding.
18	Source	MOSFET source reference for Field winding control.
19	Undervoltage	If this pin have voltage goes below 1.0 V, the fault lamp is turn on. The IC will continue to function, but with limited performance.
20	V _{REF}	Pin for the Band gap reference voltage 1.7 V ~ 2.3 V.

Note: Pin 8, and 20 are test points only
