UC2843B

LINEAR INTEGRATED CIRCUIT

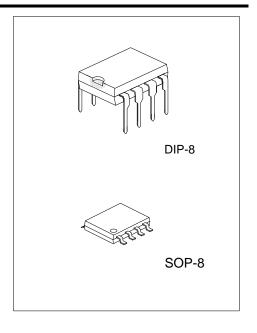

HIGH-PERFORMANCE CURRENT-MODE PWM CONTROLLERS

DESCRIPTION

UTC **UC2843B** The provides off-line DC-DC fixed-frequency current-mode control design with minimum external components. Internally-implemented circuits include an under-voltage lockout (UVLO) and a precision reference with accuracy at the error amplifier input. The UTC UC2843B also contain internal circuits which include a pulse width modulation (PWM) comparator providing current-limit control, logic ensuring latched operation, and a totem-pole output stage designed to source or sink high-peak current. The output stage is low when it is in off-state condition and suitable for N-channel MOSFETs driving.

The UTC UC2843B also has following advantages: the start-up current lower than 0.5mA while the oscillator discharge current is specified to 8.3mA (Typ.). In UVLO conditions, the output has a maximum saturation voltage of 1.2V when sinking 10mA @ $V_{CC} = 5V$.

The typical UVLO threshold of the UTC UC2843B is 8.4V (on) and 7.6V (off) and can operate to duty cycles approximately 100%.

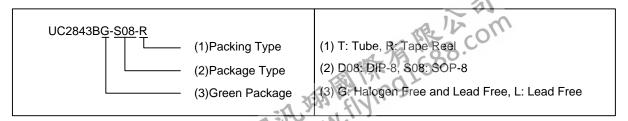

FEATURES

- * Current mode operation:500 kHz
- * Low start-up current value < 0.5mA
- * Latching PWM for cycle-by-cycle current limiting
- * Trimmed oscillator discharge current
- * Automatic feed-forward compensation
- * Internally trimmed reference with UVLO
- * High-current totem-pole output UVLO with hysteresis
- * Double-pulse suppression

MARKING

■ PIN CONFIGURATION

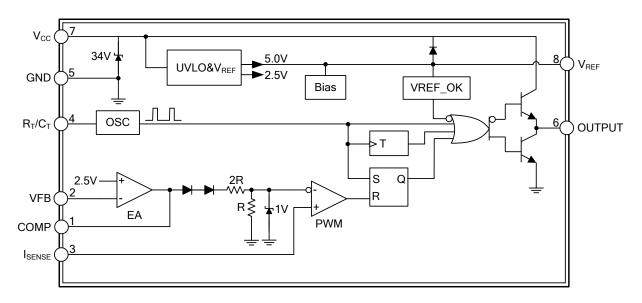

■ PIN DESCRIPTION

PIN NO.	PIN NAME	DESCRIPTION
1	COMP	This pin is the Error Amplifier output and is made available for loop compensation.
2	VFB	This is the inverting input of the Error Amplifier. It is normally connected to the switching power supply output through a resistor divider.
3	I _{SENSE}	A voltage proportional to inductor current is connected to this input. The PWM uses this information to terminate the output switch conduction.
4	R _T /C _T	The Oscillator frequency and maximum Output duty cycle are programmed by connecting resistor R_T to V_{REF} and capacitor C_T to ground. Operation to 500 kHz is possible.
5	GND	This pin is the combined control circuitry and power ground.
6	OUTPUT	This output directly drives the gate of a power MOSFET. Peak currents up to 1.0A are sourced and sunk by this pin.
7	Vcc	This pin is the positive supply of the control IC.
8	V_{REF}	This is the reference output. It provides charging current for capacitor C_T through resistor R_T .

BLOCK DIAGRAM

■ **ABSOLUTE MAXIMUM RATING** (T_A=25°C, unless otherwise specified)

PARAMETER		SYMBOL	RATINGS	UNIT
Supply Voltage (Low impedance source)		V _{CC}	30	V
Analog Input Voltage (VFB and ISENSE)		V _{IN}	-0.3~+6.3	V

Notes: 1. Adjust V_{CC} above the start threshold before setting it to 15V.

- Measured at the trip point of the latch, with VFB at 0V.
 Measured between I_{SENSE} and COMP, with the input changing from 0V ~ 0.8V.

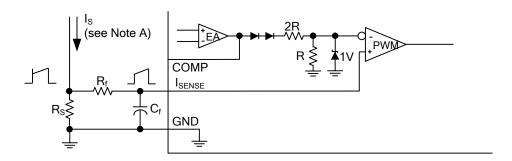

■ APPLICATION INFORMATION

Error amplifier (EA) configuration circuit:

Note: Error amplifier can source or sink up to 0.5mA.

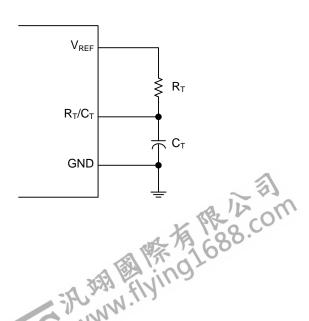

Current-sense circuit:

Notes: 1. Peak current (I_S) is determined by the formula: $I_{S(max)} = 1V/R_S$

2. A small RC filter formed by resistor R_{F} and capacitor C_{F} may be required to suppress switch transients.

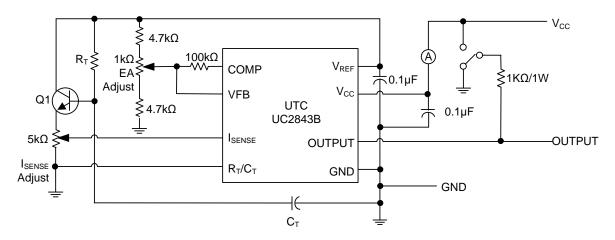

The oscillator frequency is set using the circuit:

APPLICATION INFORMATION (Cont.)

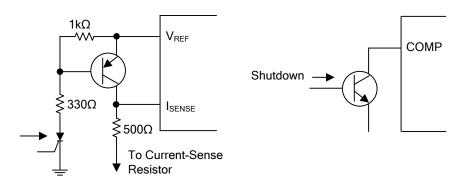

Open-Loop Laboratory Test Fixture

In the open-loop laboratory test fixture, high peak currents and loads need grounding techniques. The transistor and $5-k\Omega$ potentiometer sample the oscillator waveform, applying an adjustable ramp to the I_{SENSE} terminal. Timing and bypass capacitors should be connected closely to the GND terminal in a single-point ground.

Shutdown Technique

The PWM controller can be shut down through two methods: the one is raising voltage (above 1 V) at I_{SENSE} , the other is pulling the COMP terminal below a voltage two diode drops above ground. Either method can leave the output of the PWM comparator high (refer to block diagram). To reset the PWM latch is dominant so the output can stay low in the case of the next clock cycle is coming and the COMP or I_{SENSE} terminal is removed beyond this shutdown condition. For example, an externally-latched shutdown can be accomplished by adding an SCR reset by cycling V_{CC} below the lower UVLO threshold. So the reference turns off then allows the SCR to reset at this condition.

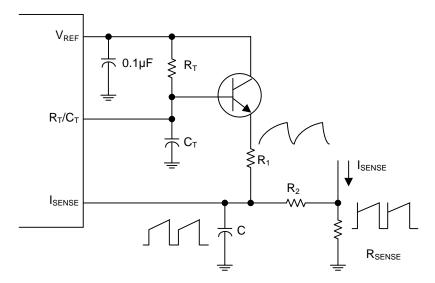

■ APPLICATION INFORMATION (Cont.)

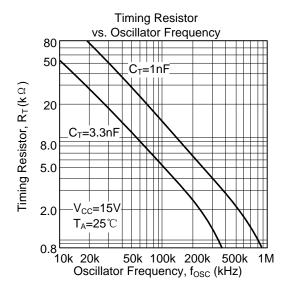

Shutdown Technique (cont.)

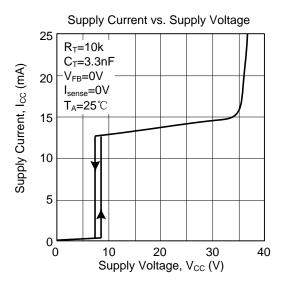

A fraction of the triangular-wave oscillator can be summed resistively with the current-sense signal providing slope compensation for converters, which requiring duty cycles over 50%. Please note that capacitor C forms a filter with R2 to suppress the leading-edge switch spikes.

■ TYPICAL CHARACTERISTICS

UTC assumes no responsibility for equipment failures that result from using products at values that exceed, even momentarily, rated values (such as maximum ratings, operating condition ranges, or other parameters) listed in products specifications of any and all UTC products described or contained herein.
