

UD05208

Preliminary

CMOS IC

1.5MHz, 2A, $V_{FB}=0.6V$ SYNCHRONOUS STEP-DOWN CONVERTER

DESCRIPTION

UTC **UD05208** devices are synchronous step-down converters optimized for small solution size and high efficiency. The devices integrate switches capable of delivering an output current up to 2A. The devices are based on an adaptive on time with valley current mode control scheme. Typical operating frequency is 1.5MHz at medium to heavy loads. The devices are optimized to achieve very low output voltage ripple even with small external components and feature an excellent load transient response. During a light load, the **UD05208** automatically enter into Power Save Mode at the lowest quiescent current (50 μ A typ) to maintain high efficiency over the entire load current range. In shutdown, the current consumption is reduced to 1 μ A. The **UD05208** provide an adjustable output voltage via an external resistor divider. The output voltage start-up ramp is controlled by an internal soft start, typically 250 μ s. Power sequencing is possible by configuring the Enable pin. Other features like over current protection and over temperature protection are built in.

FEATURES

- * 2.7V to 5.5V Input Voltage Range
- * 1.5MHz Typical Switching Frequency
- * Output Current up to 2A
- * Adaptive On-Time Current Control
- * Power Save Mode for Light Load Efficiency
- * 50 μ A Operating Quiescent Current
- * Over Current Protection
- * Internal Soft Startup of 250 μ s (Typ.)
- * Adjustable Output Voltage
- * Thermal Shutdown Protection
- * Available in SOT25 Package

PIN CONFIGURATION

PIN DESCRIPTION

PIN NO.	PIN NAME	DESCRIPTION
1	EN	Enable pin H: Normal operation ; L: Shutdown
2	GND	Ground Pin
3	SW	Switch pin connected to the internal MOSFET switches and inductor terminal. Connect the inductor of the output filter to this pin.
4	V _{IN}	Power Supply Input Pin
5	FB	Feedback pin for the internal control loop. Connect this pin to the external feedback divider.

■ DETAILED DESCRIPTION

UD05208 operates with an adaptive on-time control scheme, which is able to dynamically adjust the on-time duration based on the input voltage and output voltage so that it can achieve relative constant frequency operation. The device operates at typically 1.5-MHz frequency pulse width modulation (PWM) at moderate to heavy load currents.

POWER SAVE MODE

The device integrates a Power Save Mode with PFM to improve efficiency at light load. In Power Save Mode, the device only switches when the output voltage trips below a set threshold voltage. It ramps up the output voltage with several pulses and stops switching when the output voltage is higher than the set threshold voltage. PFM is exited and PWM mode entered in case the output current can no longer be supported in Power Save Mode.

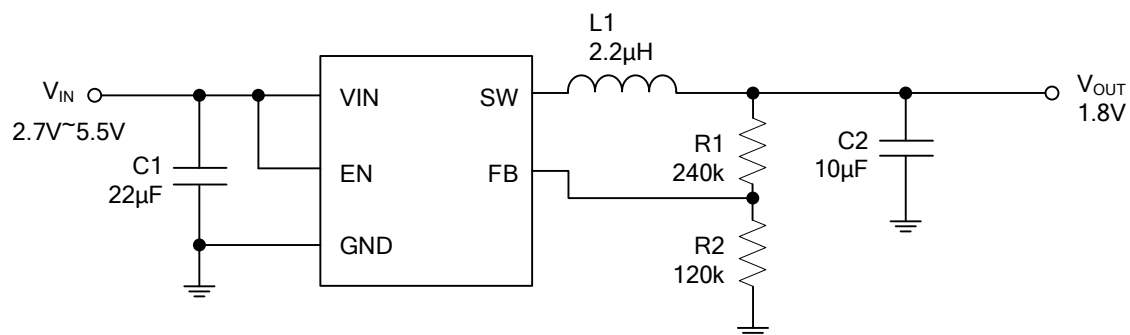

SOFT START

After enabling the device, internal soft-start circuitry monotonically ramps up the output voltage which reaches nominal output voltage during a soft-start time of 250 μ s (typical). This avoids excessive inrush current and creates a smooth output voltage rise slope.

SHORT CIRCUIT PROTECTION

To avoid mis-operation of the device, short circuit protection is implemented that latch output to GND when output short.

■ TYPICAL APPLICATION CIRCUIT

TYPICAL CHARACTERISTICS

Typical Application (PWM MODE)
($V_{IN}=3.6V$, $V_O/I_{LOAD}=1.8V/0.16A$)

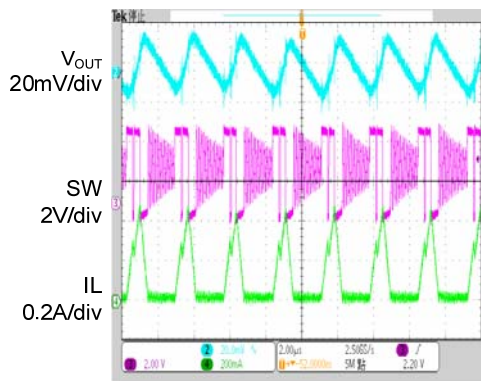

Typical Application (PFM MODE)
($V_{IN}=3.6V$, $V_O/I_{LOAD}=1.8V/0A$)

Typical Application (PFM MODE)
($V_{IN}=3.6V$, $V_O/I_{LOAD}=1.8V/0.01A$)

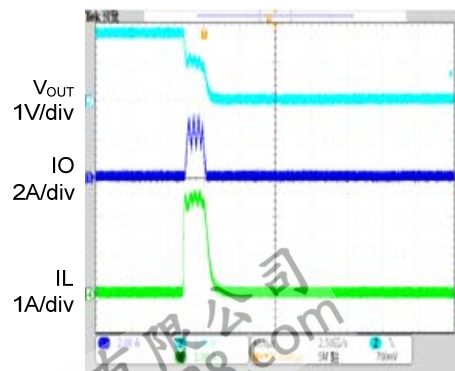

Typical Application (PFM MODE)
($V_{IN}=3.6V$, $V_O/I_{LOAD}=1.8V/0.1A$)

Switch Current Limit
($V_{IN}=3.6V$, $V_O=1.8V$)
($I_{LIM,HS}=2.9A$, $I_{LIM,LS}=1A$)

Short Circuit Protection
(V_{OUT} to Short and GND)
