

HIGH SIDE POWER SWITCHES

DESCRIPTION

The UTC **US94061** are high-side load switches incorporating a low on-resistance P-channel MOSFET which provides customers over 2A continuous current.

The UTC **US94061** is characterized by a fast turn on function. The UTC **US94061** keeps in a floating state when an active pull-down signals is on the enable input until a high level signal applies on the EN pin. Built-in level shift circuitry allows low voltage logic signals to switch to higher supply voltages, on the contrary, high level logic signals can control low level voltages.

The UTC **US94061**'s operating voltage varies from 1.8V ~ 5.5V which makes these devices suitable for 1-cell Lithium ion and 2- to 3-cell NiMH/NiCad/Alkaline powered systems as well as all 5V applications. The 2µA low operating current and low shutdown current(less than1µA) make the battery life longer.

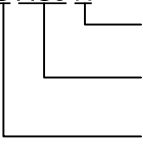

The UTC **US94061** is generally suitable for applications, such as load switch in portable devices: cellular phones, PDAs, MP3 players, digital Cameras, portable instrumentation, battery switch-over circuits and level translators.

Note: 1. $T_A = 25^\circ\text{C}$ unless otherwise noted. Absolute maximum ratings indicate limits beyond which damage to the component may occur. Electrical specifications do not apply when operating the device outside of its operating ratings. The maximum allowable power dissipation is a function of the maximum junction temperature, $T_{J(Max)}$, the junction-to-ambient thermal resistance, θ_{JA} , and the ambient temperature, T_A .

- This device is not guaranteed to operate beyond its specified operating rating.
- Mounted on 1 square-inch pad of 2 oz. copper.
- IC devices are inherently ESD sensitive. Handling precautions required.
- Pulse width < 300 μs with <2% duty cycle.
- Dynamic specifications are guaranteed by design.
- Body diode current conduction is not recommended.
