

UT213

Preliminary

CMOS IC

+3.0V TO +5.5V POWER SUPPLY, 120KBPS, MULTICHANNEL RS-232 LINE DRIVERS/RECEIVERS

DESCRIPTION

The UTC **UT213** consists of 4 drivers and 5 receivers. It meets EIA/TIA-232 and V.28/V.24 specifications, it intended for notebook computer applications. A high-efficiency, dual charge-pumps power supply and a low-dropout transmitter combine to deliver true RS-232 performance from a single +3.0V~+5.5V power supply. A guaranteed data rate of 250kbps provides compatibility with popular software for communicating with PCs.

The UTC **UT213** has an active-low shutdown and an active-high receiver enable control. Two receivers of the UTC 213 are active, allowing the ring indicator(RI)to be monitored easily using only 75uW power.

The UTC **UT213** requires only 0.1μF capacitors in 3.3V operation, and can operate from input voltages ranging from +3.0V ~+5.5V. It is ideal for 3.3V-only systems, 5.0V-only systems, or mixed 3.3V and 5.0V systems that require true RS-232 performance.

FEATURES

- * Operates With 3.0V~5.5V Power Supply
- * Four Drivers and Five Receivers
- * Operates Up To 120 kbps
- * Designed to Transmit at a Data Rate of 120 kbps
- * Low Standby Current (15μA Typical)
- * External Capacitors (4*0.1μF)
- * Accepts 5.0V Logic Input With 3.3V Supply
- * Serial-Mouse Drivability
- * Exceeds ±8KV ESD Protection(HBM) for RS-232 I/O Pins

■ DETAILED DESCRIPTION

Charge-Pump Voltage Converter

The UTC **UT213** consists of a regulated dual charge pumps that provide output voltages of +5.5V and -5.5V, regardless of the input voltage (V_{CC}) changing from +3.0V to +5.5V.

The charge pumps operate in a discontinuous mode: if the output voltages are less than 5.5V, the charge pumps are enabled; if the output voltages exceed 5.5V, the charge pumps are disabled.

Each charge pump requires a flying capacitor (C1, C2) and a reservoir capacitor (C3, C4) to generate the V+ and V- supplies, refer to application circuit.

RS-232 Transmitters

UTC **UT213**'s transmitters are inverting level translators that convert CMOS-logic levels to 5.0V EIA/TIA-232 levels. They guarantee a 120kbps data rate with worst-case loads of 3k Ω in parallel with 1000pF, providing compatibility with PC-to-PC communication software.

Input thresholds are both CMOS and TTL compatible. The inputs of unused drivers can be left unconnected since 400k Ω pullup resistors to V_{CC} are included on-chip. Since all drivers invert, the pullup resistors force the outputs of unused drivers low. The input pullup resistors typically source 15 μ A; therefore, the driver inputs should be driven high or open circuited to minimize power-supply current in shutdown mode.

RS-232 Receivers

The UTC **UT213**'s receivers convert RS-232 signals to CMOS logic output levels. Receiver outputs are inverting, maintaining compatibility with driver outputs. The guaranteed receiver input thresholds of +0.8V and +2.4V are significantly tighter than the Q3.0V threshold required by the EIA/TIA-232E specification. This allows receiver inputs to respond to TTL/CMOS logic levels and improves noise margin for RS-232 levels.

Receiver inputs have approximately +0.5V hysteresis. This provides clean output transitions, even with slow rise and fall time input signals with moderate amounts of noise and ringing. In shutdown, the UTC **UT213**'s receivers R4 and R5 have no hysteresis.

During normal operation, the UTC **UT213**'s receiver propagation delay is typically 1 μ s. When entering shutdown with receivers active, R4 and R5 are not valid until 80Fs after SHDN is driven low. In shutdown mode, propagation delays increase to 4 μ s for a high-to-low or a low-to-high transition.

Shutdown Function

In shutdown mode, the UTC **UT213**'s charge pumps are turned off, V+ is pulled down to V_{CC} , V- is pulled to ground, and the transmitter outputs are disabled. This reduces supply current typically to 15 μ A. The time required to exit shutdown is 1ms, All receivers except R4 and R5 on the UTC **UT213** are put into a high-impedance state in shutdown mode. The UTC **UT213**'s R4 and R5 receivers still function in shutdown mode. These two receivers are useful for monitoring external activity while maintaining minimal power consumption.

The enable control is used to put the receiver outputs into a high-impedance state, so that the receivers can be connected directly to a three-state bus. It has no effect on the RS-232 drivers or on the charge pumps.
