

## UTRS3080

Preliminary

CMOS IC

### FAIL-SAFE, 500KBPS, RS-485 / RS-422 TRANSCEIVERS WITH $\pm 12KV$ ESD-PROTECTED

#### DESCRIPTION

The UTC **UTRS3080** high-speed transceivers for RS-485/RS-422 communication contain one driver and one receiver. The device features fail-safe circuitry, which guarantees a logic-high receiver output when the receiver inputs are open or shorted. This means that the receiver output will be logic high if all transmitters on a terminated bus are disabled (high impedance). The UTC **UTRS3080** features reduced slew-rate drivers that minimize EMI and reduce reflections caused by improperly terminated cables, allowing error-free data transmission up to 500kbps.

The transceiver typically draws 375 $\mu A$  of supply current when unloaded or when fully loaded with the drivers disabled.

A device has a 1/8-unit-load receiver input impedance that allows up to 256 transceivers on the bus.

#### FEATURES

- \* True fail-safe receiver while maintaining EIA/TIA-485 compatibility

### MARKING

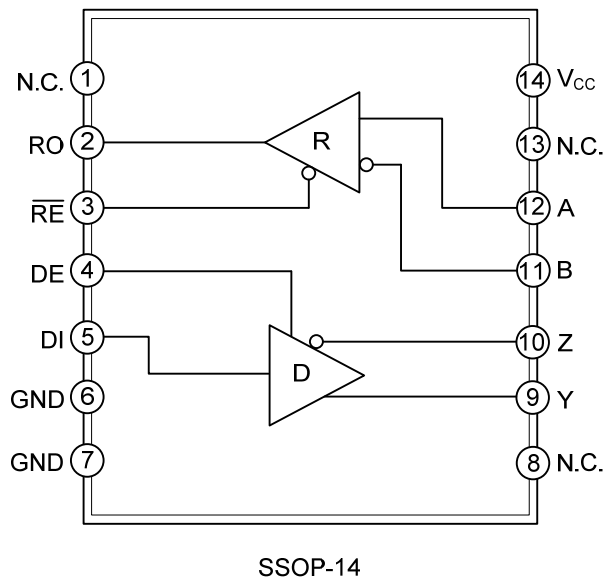

### PIN CONFIGURATION

### PIN DESCRIPTION

PIN NO.	PIN NAME	DESCRIPTION
1, 8, 13	N.C.	Not connected. Not internally connected.
2	RO	Receiver output. When $\overline{RE}$ is low and if $A-B \geq -20mV$ , RO will be high; if $A-B \leq -200mV$ , RO will be low.
3	$\overline{RE}$	Receiver output enable. Drive $\overline{RE}$ low to enable RO; RO is high impedance when $\overline{RE}$ is high. Drive $\overline{RE}$ high and DE low to enter low-power shutdown mode.
4	DE	Driver output enable. Drive DE high to enable driver outputs. These outputs are high impedance when DE is low. Drive $\overline{RE}$ high and DE low to enter low-power shutdown mode.
5	DI	Driver input. With DE high, a low on DI forces non-inverting output low and inverting output high. Similarly, a high on DI forces non-inverting output high and inverting output low.
6, 7	GND	Ground
9	Y	Non-inverting driver output
10	Z	Inverting driver output
11	B	Inverting receiver input
12	A	Non-inverting receiver input
14	$V_{CC}$	Positive supply; $4.75V \leq V_{CC} \leq 5.25V$

If the enable inputs are in this state for at least 600ns, the device is guaranteed to have entered shutdown.
